

Model Architecture Flow

Multi-view multi-task network with cross-modal fusion transformer

Role of this network in the delivered system

• The headline classification is NOT produced by this network.

It is computed by applying the project's arch-height bands to the measurement retrieved from the consolidated records. Deterministic rule, not learned inference. Rule path test macro F1: **99.50%**.

• The network supports two secondary functions:

- (1) Measurement estimation from images — used only when a patient is absent from records (ESTIMATED path, sub-100% confidence).
- (2) Insole configuration — class-conditional generative output for the recommendation panel.
